

entropy needs discrete/measure  
convention and finite  $H_b^{\max}$

opacity should modulate  $\gamma$ , not erase  
predictable disturbance by default

$H_b^{A|B}(t, \tau)$   
action unpredictability

agent  $A$   
future action

prediction channel

observer  $B$   
filtration  $\mathcal{F}_B^t$

cooperative value  
low  $H_b^{A|B}$  helps coordination

adversarial value  
high  $H_b^{A|B}$  helps surprise

keep directions separate: attacker opacity  $H_b^{A|B}$  vs target opacity  $H_b^{B|A}$
