

unknown · lossy

“Markov-by-breadth” — same move, asymmetric cost

unbounded:
augment freely
(WLOG)

bounded $\phi(\mathcal{C}_t)$:
augment $\rightarrow$ wall
(has teeth)

*The loop closes only through
two opaque maps. Knowing
either trivializes adaptation.*

*THREAD-B: segment frames both
as cost-free “commitments about
breadth”; only the Ω side actually is.*
