

$\mathcal{C}_t$: ordinal ratchet — append-only, irreversible fork: duplicate the agent

Synthesis of seg-03 (lossy ϕ) seg-04 (non-forkable $\mathcal{C}$): the record cannot fork, but the agent's only access (M_t) can — and collapses divergent records together. Make ϕ injective $\Rightarrow$ branches separate at M (forks detectable); heavier loss $\Rightarrow$ more branch-pairs indistinguishable. [THREAD-E; defer to #scope-agent-identity]
