

ANCHOR — the sleeper's two times

subjective (ordinal)

no gap in the story

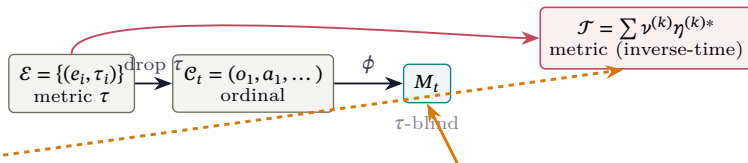

wall-clock (metric)

3 months — real, unobserved

The sleeper's $\mathcal{C}_t$ has **no gap**; the calendar does. The gap is felt only as **shock in δ** on waking — $M_t = \phi(\mathcal{C}_t)$ is time-blind.

SKELETON — metric $\mathcal{E} \rightarrow$ ordinal $\mathcal{C}_t \rightarrow M_t \cdot$ F4 seam

► F4 the $\mathcal{C}_t \leftrightarrow \mathcal{E}$ relation & “ M_t τ -blind; persistence metric on ordinal state” live ONLY in ‘def-chronica’ Working Notes — published *nowhere*

Solid = theory's voice (each piece individually correct). ► amber = the audit's voice: the relationship between the ordinal agent and the metric inequality, and its sleeping-agent consequence, are WN-only + partial NOTATION t/τ . Low-severity integration debt; strengthen-fix = lift one paragraph WN $\rightarrow$ published. Also a §F candidate (first-class ordinal/metric duality sharpens persistence + chronica + Three-Deaths).
